

SKYSUN | WHAT – HOW – WHY ?

Employ the sky, embrace the sun

WHAT | Mission & Vision

Our mission is to prove the economic value of renewable energy. We add value to the roof surfaces of property owners through solid management and financing solutions. Skysun is the financial bridge between new technologies and civil society.

Skysun's vision is to accelerate the transition to renewable energy by simplifying access to it. We believe in energy independence and decentralization of production facilities.

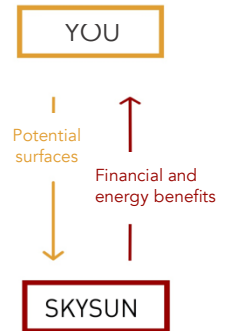

HOW | Business model

Win-win partnerships with property owners.

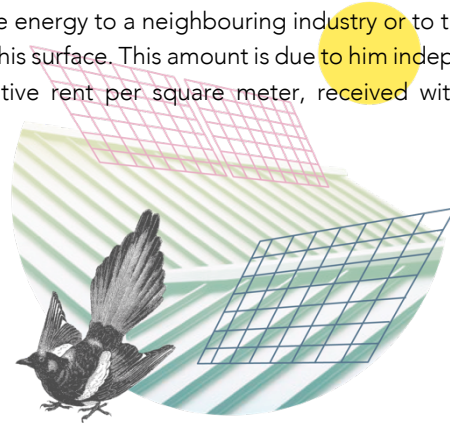

Skysun finances photovoltaic installations on the surfaces made available to it and makes this investment profitable through the resale of the green and decentralized energy produced.

Two cases are possible:

- A) The owner consumes 100% of the electricity produced and thus makes large energy savings. The owner benefits from all the advantages of a photovoltaic power plant (economic - ecological) without bearing the cost or the management. The latter buys the energy from Skysun up to 30% cheaper than from the public grid.

- B) Skysun negotiates a contract for the re-injection of the energy to a neighbouring industry or to the public grid. The owner receives a fixed income for the use of his surface. This amount is due to him independently of the performance of the installation. It is a lucrative rent per square meter, received without any investment on his part and fixed over 10-15-20 years.

WHY | Benefits

- Energy savings
- Maintenance of roofs at the expense of Skysun
- Income over 10-15-20 years without initial investment
- Impact on the company's image (CSR)
- Renewable energy production
